Waste Incinerator Service

Sprint info

Sprint name	Sprint 1
Previous sprint	[Sprint 0](#)
Next sprint	
QAK model	[sprint1.qak](#)
Developed by	Alessio Benenati Giulia Fattori

Sprint Starting Condition and Goals

In the previous sprint we focused on requirements analysis and we produced a simple base archictecture of what could be inferred by the assignement text. in this sprint we will focus on the relationship between WIS and OpRobot, our goals are

- finding the best way to divide the buisness logic between the OpRobot and the WIS actor
- consequently choosing the right model (**Actor** or **POJO**) for the OpRobot
- producing a simple prototype of the system reproducing the functioning of this two entities

Problem Analysis

OpRobot and WIS

When considering how to divide the business logic between components, we identified two main approaches:

- **Centralized Solution**: In this approach, the OpRobot functions as a simple POJO, acting as an executor for WIS. WIS takes responsibility for monitoring the system's state and instructs the OpRobot to move accordingly.
- **Distributed Solution**: Here, the OpRobot is designed as an Actor that interacts with WIS. The OpRobot requests WIS, which observes the system's state, to confirm whether conditions for movement are met. If they are, the OpRobot initiates an 'OpRobot Cycle,' which includes obtaining an RP, incinerating it, and transporting the ashes to ashStorage.

Pro e Contro

- Centralizzato:
    - logica di buinsess concentrata
    - (poco estendibile)
